

# Assess your emotional expressions in motion

---

Assessing emotional expressions and degree of animation are one of the facets of the facial assessment clinical evaluation.

**Relaxed face, Pursed kiss, Angry face, Big smile, Grimace**

## Pioneering study captures natural expression

Restylane gel technologies break new ground to achieve natural looking results – while at rest and in motion.<sup>1,2,3</sup>

A unique and innovative trial was developed to quantitatively measure the degree of stretch and compression in facial expression using strain-mapping technology<sup>2</sup> to analyze before and after videos.

Restylane treatments provided clinically significant improvement (compared to baseline). The treatments reduced the degrees of stretch to levels resembling a younger person. Animation of the lower face, such as smiling and lip pursing, looked more attractive and youthful, without compromising naturalness.<sup>2</sup>

Not intended for French HCPs.
